

Celxpert Energy(KunShan)Corporation Battery Pack UN38.3 Test Report

Customer:	Lenovo
Model:	L20C4PC2
Nominal voltage:	15.36V
Rating Capacity:	Rated Capacity:5100mAh /78Wh Typical Capacity:5210mAh/80Wh
Issue Date:	Aug ,31 2020

1.UN38.3 Lithium Battery Test Summary

Edition of UN Manua Criteria Used	l of Tests and	ST/SG/AC.10/1	11/Rev.6/Amend.1	
Customer	Lenovo	Sample type	Rechargeable Li-ion Battery	
Model Name	L20C4PC2	Pack Configuration	4S1P	
Rating	Rated Capacity:5100mAh /78Wh Typical Capacity:5210mAh/80Wh	Battery weight	358g	
Cell Factory/Model	ATL 3862E1-010H/L 5400mAh AC85	Physical Pescription		
Factory Address	ctory Address Kunshan City, Jiangsu Province, P.R.		NO.1111, Hanpu Road, Yushan Town, Kunshan City, Jiangsu Province, P.R. China	
Factory Name	elxpert (kunshan) Enengy.Co,Ltd. Laboratory Name		CPK LAB	
Factory Tel	86-512-57775999 Laboratory Tel		+86-512-57775999	
Factory E-mail	rank_Gao@cn.celxpert.com Lab E-mail		Frank_Gao@cn.celxpert.com	
Factory Web	www. celxpert.com.tw	Laboratory Web	www. celxpert.com.tw	
Client Date	2020/07/24 Completing Data		2020/08/29	
Item	Test Item		Test Result(Pass/Fail)	
38.3.4.1 T1	Altitude simulation		Pass	
38.3.4.1 T2	Thermal		Pass	
38.3.4.1 T3	Vibration		Pass	
38.3.4.1 T4	Shock		Pass	
38.3.4.1 T5	External Short Circuit		Pass	
38.3.4.1 T6	Crush		Pass	
38.3.4.1 T7	Overcharge	Overcharge

5.Test method and verdict

Cells and batteries meet this requirement if there is no leakage, no venting, no disassemble, no rupture and no fire and if the open circuit voltage of each test cell or battery after testing is not less than 90% of its voltage immediately prior to this procedure. The requirement relating to voltage is not applicable to test cells and batteries at fully discharged states. T3:Vibration This test simulates vibration during transport Cells and batteries are firmly secured to the platform of the vibration machine without distorting the cells in such a manner as to faithfully transmit the vibration. The vibration shall be a sinusoidal waveform with a logarithmic sweep between 7 Hz and 200 Hz and back to 7 Hz traversed in 15 minutes. This cycle shall be repeated 12 times for a total of 3 hours for each of three mutually perpendicular mounting positions of the cell. One of the directions of vibration must be perpendicular to the terminal face. For cells and batteries meet this requirement if there is no leakage, no venting, no venting, no leakage, no venting, no leakage, no venting, n	
Mass M of cell or battery Mass loss limit Mode 0.5% 1.5 ≤ Mode 0.1%	
38.3.4.1 Modg 0.5% 18.5M = 75g 0.2% 18.5M = 75g 0.18 T1: Altitude simulation This test simulates air transport under low-pressure conditions Test cells and batteries shall be stored at a pressure of 11.6kPa or less for at least six hour at ambient temperature (20±5°C) Cells and batteries meet this requirement if there is no leakage, no venting, no disassemble, no rupture and no fire and if the open circuit voltage of each test cell or battery after testing is not test than 90% of its voltage immediately prior to this procedure. The requirement relating to voltage is not applicable to test cells and batteries at fully discharged T2:Thermal test T2:Thermal test This test assesses cell and battery seal integrity and internal electrical connections. The test is conducted using rapid and extreme temperature changes. Test cells and batteries are to be stored for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a stest temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storag	
T1: Altitude simulation This test simulates air transport under bw-pressure conditions Test cells and batteries shall be stored at a pressure of 11.6kPa or less for at least six now at ambient temperature (20±5°C) Cells and batteries meet this requirement if there is no leakage, no venting, no disassemble, no rupture and no fire and if the open circuit voltage of each test cell or battery after testing is not less than 90% of its voltage immediately prior to this procedure. The requirement relating to voltage is not applicable to test cells and batteries at fully discharged by the states. T2:Thermal test This test assesses cell and battery seal integrity and internal electrical connections. The test is conducted using rapid and extreme temperature changes. Test cells and batteries are to be stored for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a step temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a step temperature equal to 72±2°C, followed by storage for at least six hours at a step temperature equal to 72±2°C, followed by storage for at least six hours at a step temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage for at least six hours at a test temperature equal to 72±2°C, followed by storage f

distorting the cells in such a manner as to faithfully transmit the vibration. The vibration shall be a sinusoidal waveform with a bigarithmic sweep between 7 Hz and 200 Hz and back to 7 Hz traversed in 15 minutes. This cycle shall be repeated 12 times for a total of 3 hours for each of three mutually perpendicular mounting positions of the cell. One of the directions of vibration must be perpendicular to the terminal face. No leakage	
I O I COID AND SMAN PARCEICS, ITOM / TIZ A POAK ACCECTACION OF TEN 15 MAINAMEN UND TO	
Hz is reached. The amplitude is then maintained at 0.8 mm (1.6 mm total excursion) and the frequency increased until a peak acceleration of 8gn occurs (approximately 50 Hz). A peak acceleration of 8gn is then maintained until the frequency is increased to 200 Hz.	
For large batteries: from 7 Hz to a peak acceleration of 1gn is maintained until 18 Hz is reached. The amplitude is then maintained at 0.8 mm (1.6 mm total excursion) and the frequency increased until a peak acceleration of 2gn occurs (approximately 25 Hz). A peak acceleration of 2gn is then maintained until the frequency is increased to 200 Hz.	
Cells and batteries meet this requirement if there is no leakage, no venting, no disassemble, no rupture and no fire during the test and after the test and if the open circuit voltage of each test cell or battery directly after testing in its third perpendicular mounting position is not less than 90% of its voltage immediately prior to this procedure. The requirement relating to voltage is not applicable to test cells and batteries at fully discharged states.	

Clause	Requirements	Verdict		
	T4:Shock			
	This test assesses the robustness of cells and batteries against cumulative shocks			
	Test cells and batteries shall be secured to the testing machine by means of a rigid mount which will support all mounting surfaces of each test battery			
38.3.4.4	Each cell shall be subjected to a half-sine shock of peak acceleration of 150gn and pulse duration of 6 milliseconds. Alternatively, large cells may be subjected to a half-sine shock of peak acceleration of 50gn and pulse duration of 11 milliseconds. Each battery shall be subjected to a half-sine shock of peak acceleration depending on	No leakage no venting no disassemble no rupture		
	the mass of the battery. The pulse duration shall be 6 milliseconds for small batteries and 11 milliseconds for large batteries. The formulas below are provided to calculate the appropriate minimum peak accelerations.	no fire. voltage not less than 90% Mass loss limit		
	Each cell or battery is subjected to three shocks in the positive direction followed by three shocks in the negative direction of each of three mutually perpendicular mounting positions of the cell for a total of 18 shocks.	(see table 38.3.1)		
	Cells and batteries meet this requirement if there is no leakage, no venting, no disassemble, no rupture and no fire and if the open circuit voltage of each test cell or battery after testing is not less than 90% of its voltage immediately prior to this procedure. The requirement relating to voltage is not applicable to test cells and batteries at fully discharged states.			
	T5:External short circuit			
	This test simulates an external short circuit			
38.3.4.5	The cell or battery to be tested shall be shall be heated for a period of time necessary to reach a homogeneous stabilized temperature of $57\pm4^{\circ}\text{C}$, measured on the external case. This period of time depends on the size and design of the cell or battery and should be assessed and documented. If this assessment is not feasible, the exposure time shall be at least 6 hours for small cells and small batteries, and 12 hours for large cells and large batteries. Then the cell or battery at $57\pm4^{\circ}\text{C}$ shall be subjected to one short circuit condition with a total external resistance of less than 0.1 ohm.	no disassemble no rupture no fire. Packs exterior peak		
	This short circuit condition is continued for at least one hour after the cell or battery external case temperature has returned to 57 \pm 4 °C, or in the case of the large batteries, has decreased by half of the maximum temperature increase observed during the test and remains below that value.	temperature <170°C Mass loss limit (see table 38.3.1)		
	The short circuit and cooling down phases shall be conducted at least at ambient temperature.			
	Cells and batteries meet this requirement if their external temperature does not exceed 170° C and there is no disassemble, no rupture and no fire within six hours of this test.			

Clause	Requirements	Verdict
	T6: Crush / Impact	
	These tests simulate mechanical abuse from an impact or crush that may result in an internal short circuit.	
	Impact applicable to cylindrical cells not less than 18.00 in diameter.	
	The test sample cell or component cell is to be placed on a flat smooth surface. A 15.8mm±0.1mm diameter, at least 6cm long, or the longest dimension of the cell, whichever is greater, Type 316 stainless steel bar is to be placed across the centre of the sample. A 9.1 kg ± 0.1kg mass is to be dropped from a height of 61 ± 2.5 cm at the intersection of the bar and sample in a controlled manner using a near frictionless, vertical sliding track or channel with minimal drag on the falling mass. The vertical track or channel used to guide the falling mass shall be oriented 90 degrees from the horizontal supporting surface.	
	The test samples is to be impacted with its longitudinal axis parallel to the flat surface and perpendicular to the longitudinal axis of the 15.8mm±0.1mm diameter curved surface lying across the centre of the test samples. Each sample is to be subjected to only a single impact.	
38.3.4.6	Crush applicable to prismatic, pouch, coin/button cells and cylindrical cells less than 18mm in diameter.	no disassemble no rupture
36.3.4.0	A cell or component cell is to be crushed between two flat surfaces. The crushing is to be gradual with a speed of approximately 1.5cm/s at the first point of contact. The crushing is to be continued until the first of the three options below is reached. (a) The applied force reaches 13kN±0.78kN; Example: The force shall be applied by a hydraulic ram with a 32 mm diameter piston until a pressure of 17 MPa is reached on the hydraulic ram (b) The voltage of the cell drops by at least 100mV; or (c) The cell is deformed by 50% or more of its original thickness.	no fire. not exceed 170°C Mass loss limit (see table 38.3.1)
	Once the maximum pressure has been obtained, the voltage drops by 100mV or more, or the cell is deformed by at least 50% of its original thickness, the pressure shall be released	
	A prismatic or pouch cell shall be crushed by applying the force to the widest side. A button/coin cell shall be crushed by applying the force on its flat surfaces. For cylindrical cells, the crush force shall be applied perpendicular to the longitudinal axis.	
	Each test cell or component cell is to be subjected to one crush only. The test Samples shall be observed for a further 6 h. The test shall be conducted using test cells or component cells that have not previously been subjected to other tests. Cells and component cells meet this requirement if their external temperature does not	
	exceed 170°C and there is no disassemble and no fire during the test and within six hours after this test.	

Clause	Requirements	Verdict				
	T7:Ovecharge					
	This test evaluates the ability of a rechargeable battery or a single cell rechargeable battery to withstand an overcharge condition					
	The charge current shall be twice the manufacturer's recommended maximum continuous charge current. The minimum voltage of the test shall be as follows:					
38.3.4.7	(a) When the manufacturer's recommended charge voltage is not more than 18V, the minimum voltage of the test shall be the lesser of two times the maximum charge voltage of the battery or 22V.	No disassemble no fire. Mass loss limit				
	(b) When the manufacturer's recommended charge voltage is more than 18V, the minimum voltage of the test shall be 1.2 times the maximum charge voltage.	(see table 38.3.1)				
	Tests are to be conducted at ambient temperature; the duration of the test shall be 24 hours					
	Rechargeable batteries meet this requirement if there is no disassemble and no fire during the test and within seven days after the test.					
	T8:Forced discharge					
	This test evaluates the ability of a primary or a rechargeable cell to withstand a forced discharge condition					
	Each cell shall be forced discharged at ambient temperature by connecting it in series with a 12V D.C. power supply at an initial current equal to the maximum discharge current specified by the manufacturer.	no disassembly no fire Mass loss limit				
	The specified discharge current is to be obtained by connecting a resistive load of the appropriate size and rating in series with the test cell Each cell shall be forced discharged for a time interval (in hours) equal to its rated capacity divided by the initial test current (in ampere).	(see table 38.3.1)				
	Primary or rechargeable cells meet this requirement if there is no disassembly and no fire during the test and within seven days after the test.
